

Shopify Store QA Checklist (Quick)

Run monthly, after theme edits, and after installing/uninstalling apps.

1) App uninstall cleanup

- Duplicate the live theme and test on the duplicate.
- Disable related Theme App Embeds.
- Search theme.liquid + key templates for leftover snippet includes.
- Remove references first, delete unused files later.

2) Script hygiene

- List third-party domains on product + cart pages.
- Remove duplicates (embed + snippet, pixel in two places, similar apps).
- Scope heavy widgets to fewer pages when possible.

3) High-risk theme areas

- layout/theme.liquid: new scripts, duplicated assets, global includes.
- Header/nav: mobile menu, search, sticky header behavior.
- Product/cart: variants, add-to-cart, cart updates, checkout start.

4) Discounts + content

- Review active discounts, assign an owner, disable unknown ones.
- Fix top product gaps: missing descriptions, broken images, confusing titles.

5) Metafields

- Review new namespaces/keys, standardize naming, remove dead keys in phases.
